If a web page contains content originated from both secure and non-secure websites (i.e. a Desire2Learn course content page with embedded video), the browser may display a security warning. The warning is displayed differently depending on the browser being used.

This handout illustrates the different warning dialogs from the following browsers and the necessary steps to properly display the content:

- Internet Explorer 8, 9, and 10
- Google Chrome
- Mozilla Firefox
Internet Explorer 8

1. Click **No** in the **Security Warning** dialog to display the content.

Internet Explorer 9 & 10

2. The warning will appear at the bottom of the browser window. Click **Show all content** to display the content.
Google Chrome

1. Click the gray shield icon to the right of the address bar.
2. Click Load unsafe script.
Firefox 23 or above

Firefox 23 has enabled the mixed content blocking by default. To display the mixed content:

1. Click the gray shield icon to the left of the address bar.
2. Click the arrow next to the Keep Blocking button to bring up the drop-down menu.
3. Click Disable Protection on This Page.
